

IMPORTANT INFORMATION ABOUT YOUR WATER SERVICE LINE

PWS ID: TX0710078 PWS Name: Fort Bliss Biggs Army Airfield Date: 03OCT25

After completing an inventory of our water service lines, we have determined that your water service line material is **unknown** (see definitions below). Please see the attached list for all affected buildings.

- **Lead** – a portion of or the entire service line is made from lead. People living in homes with a lead service line may have an increased risk of exposure to lead from their drinking water.
- **Galvanized Requiring Replacement** – a portion of or the entire service line is made from galvanized material and may have absorbed lead from upstream lead lines. People living in homes with a galvanized service line that has absorbed lead may have an increased risk of exposure to lead from their drinking water.
- **Unknown (may contain lead)** – a portion of or the entire service line material is unknown and may be lead or galvanized requiring replacement.

Please note that our latest Lead and Copper sample results, collected in August 2024, meet all applicable Environmental Protection Agency (EPA) and Texas Commission on Environmental Quality (TCEQ) drinking water quality standards. Although your water line material is unknown, the overall water quality of your water system is known and meets all applicable drinking water standards. In addition, beginning in CY2025, Fort Bliss Water Services Company (FBWSC) will be actively conducting physical verification of all unknown service lines. Any service lines requiring replacement will be scheduled for replacement. FBWSC is following all EPA and TCEQ regulations and will continue to sample for Lead and Copper as required by the TCEQ. In the event of a water quality concern, FBWSC will notify the appropriate personnel per the TCEQ drinking water notification requirements.

Health effects of Lead

Exposure to lead can cause serious health effects in all age groups. Infants and children can have decreases in IQ and attention span. Lead exposure can lead to new learning and behavior problems or exacerbate existing learning and behavior problems. The children of women who are exposed to lead before or during pregnancy can have increased risk of these adverse health effects. Adults can have increased risks of heart disease, high blood pressure, kidney, or nervous system problems.

Steps You Can Take to Reduce Your Exposure to Lead in Your Water

Below are recommended actions that you may take, separately or in combination, if you are concerned about lead in your drinking water. The list also includes where you may find more information and is not intended to be a complete list or to imply that all actions equally reduce lead from drinking water.

- **Use your filter properly.** Using a filter can reduce lead in drinking water. If you use a filter, it should be certified to remove lead. Read any directions provided with the

QR-2

QR-2

filter to learn how to properly install, maintain, and use your cartridge and when to replace it. Using the cartridge after it has expired can make it less effective at removing lead. Do not run hot water through the filter. For more information, use the QR codes for EPA's (QR-1) [tool to identify certified filters](#), and (QR-2) [fact sheet on home filtration](#).

- **Clean your aerator.** Regularly remove and clean your faucet's screen (also known as an aerator). Sediment, debris, and lead particles can collect in your aerator. If lead particles are caught in the aerator, lead can get into your water.
- **Use cold water.** Do not use hot water from the tap for drinking, cooking, or making baby formula as lead dissolves more easily into hot water. Boiling water does not remove lead from water.
- **Run your water.** The more time water has been sitting in your home's pipes, the more lead it may contain. Before drinking, flush your home's pipes by running the tap, taking a shower, doing laundry, or doing a load of dishes. The amount of time to run the water will depend on whether your home has a lead service line, the length and diameter of the service line and the amount of plumbing in your home.
